The MBE-3700 Series Borehole Extensometer Electrical/Mechanical (E/M), single or Multi-Point Borehole Extensometers are used to accurately measure longitudinal displacement in rock masses or concrete boreholes. It is particularly useful for distinguishing deep seated movements from surface spalling, which is of value in assessing the need for or determining the efficiency of a rock bolting system. The rugged low cost rod extensometer is designed to be easily installed in difficult locations.

►► **FEATURES:**

- Easy to install
- Standard design to use mechanically/electronically
- Highly accurate when used with vibrating wire displacement sensors
- In built Thermistor and gas discharge tube
- Individual sensors for multi-point applications
- Light weight

►► **TYPICAL APPLICATION:**

- Deformation around tunnels. Mines and other excavations
- Settlement of structures
- Stability of natural and cut slopes
- Deformation in dams and embankments
- Displacement of structures

2. Protective cap
3. Rod guide tube
4. Reference plane
5. Spring steel rods
6. Semi-rigid plastic tube
7. External polyethylene sheath
8. Ribbed steel anchors

►► DESCRIPTION:

The MBE-3700 Series E/M Borehole Extensometer is comprised of a group of 1 to 6 stainless steel/fiber rods individually sheathed in a protective rigid PVC pipe and attached to an anchor. A reference head, anchored at the surface terminate the protective PVC pipe. Movement of the anchor relative to the head changes the distance between the head and the force end of the rod. Two types of head are available. The model (Mechanical) uses a dial or depth gauge to measure change in distance. The depth gauge has an engraved scale or digital readout. The model with remote sensor uses simultaneous Vibrating Wire displacement transducers MBE 3800 to measure the change in distance Single-Point and Multi point head configuration is available for both models Vibrating Wire displacement transducers has a built-in thermistor facility to read temperature. All displacement transducers are available to monitor anchor movements remotely and are sealed against moisture and water intrusion. A watertight overall housing seals the former; the transducer casing and housing doubly seals the latter. Both head terminate with protective capes that are removable. The heads are grouted in place at the borehole collar.

►► READING AND INTERPRETATION:

Both electrical and mechanical readings can be taken. Mechanical readings are taken with either a dial gauge or depth gauge. Electrical readings are obtained from the output of the MBE-3800 Vibrating Wire type transducers.
